I. Project Specification

The purpose of this document is to collect, analyze, and define high-level needs and features of the Arch Climbing Wall (ACW) Web Application. It focuses on the capabilities needed by the stakeholders and the target users, and why these needs exist. The details of how the ACW Web Application fulfills these needs are detailed in the use-case and supplementary specifications.

II. Elaboration – Iteration 1.1

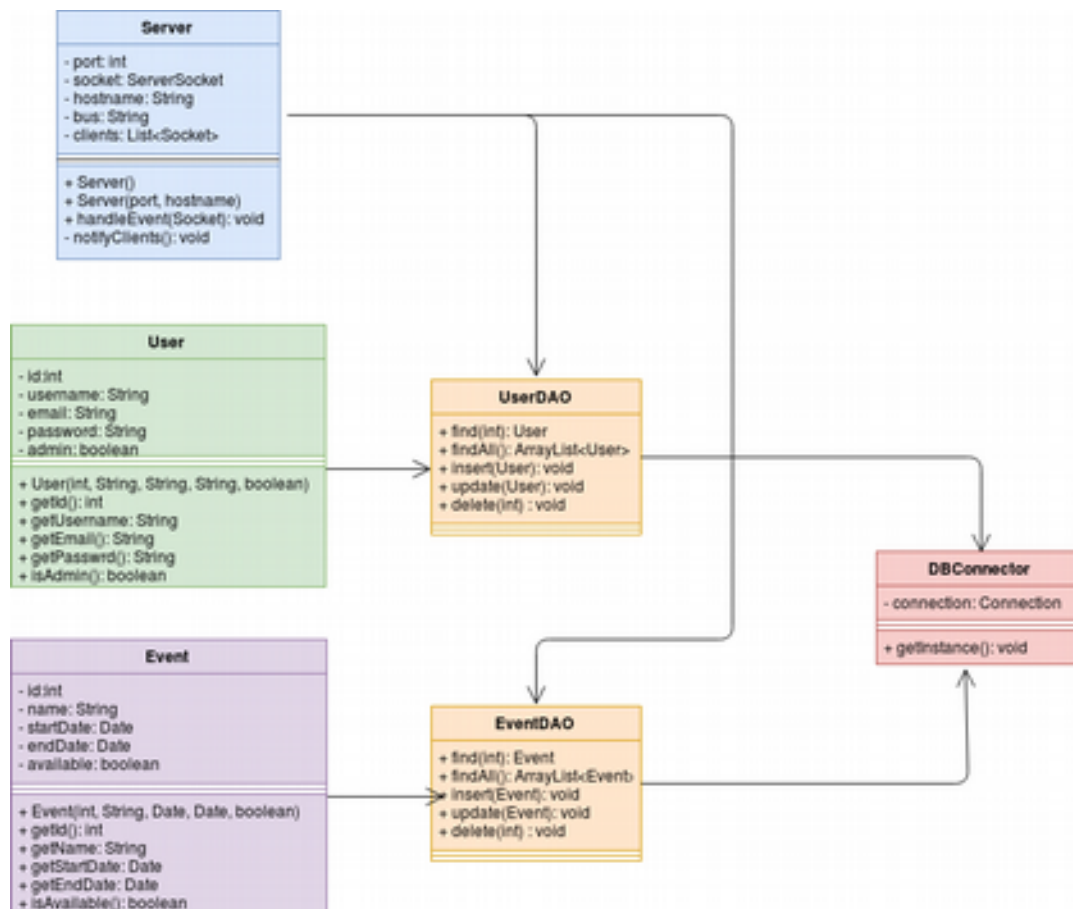

1. Domain Model

The Client will contain 1 model:

- User – represents a user, either the active one or inactive one.

The Server consists of the following models:

- User – same as above;
- Event;
- Course;

AWA	Version: <1.0>
Analysis and Design	Date: <10/04/2018>

2. Architectural Design

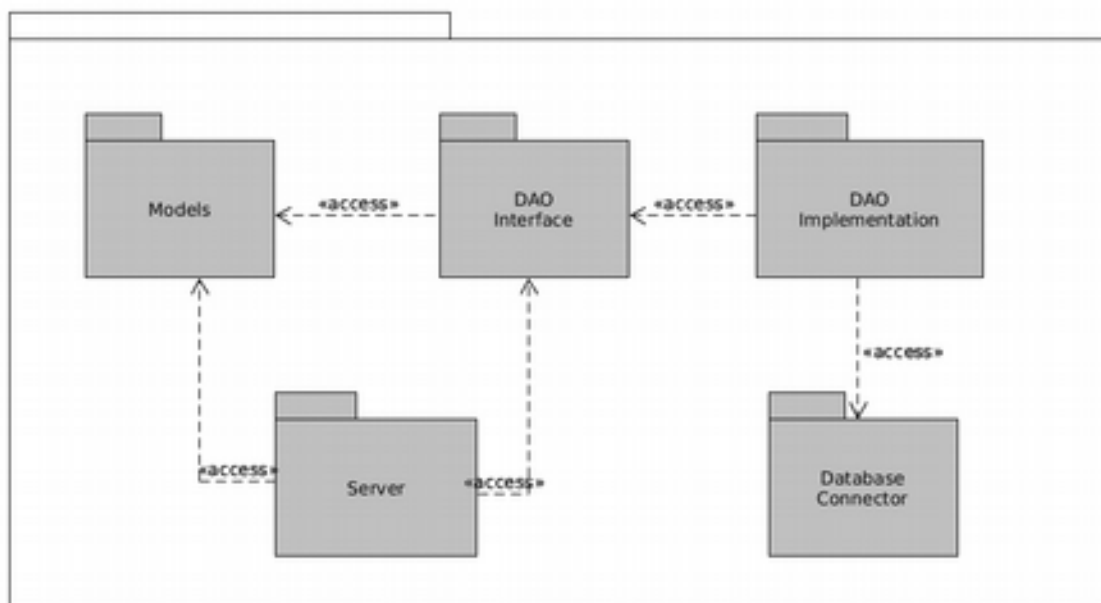

2.1 Conceptual Architecture

The system consists of two endpoints : the users and the server. The used architectural patterns are:

3. Client – Server : The server sends request / response messages to each client at a given point in time and vice-versa. While communicating with all its clients, the server also listens for new connections;
4. Event Bus : The server acts as a virtual bus. Every client listens for events while performing playback. When a client wants to perform an action (eg. pause, stop), it sends a message to the server telling it to place the message on the bus, and all the other clients are then notified.

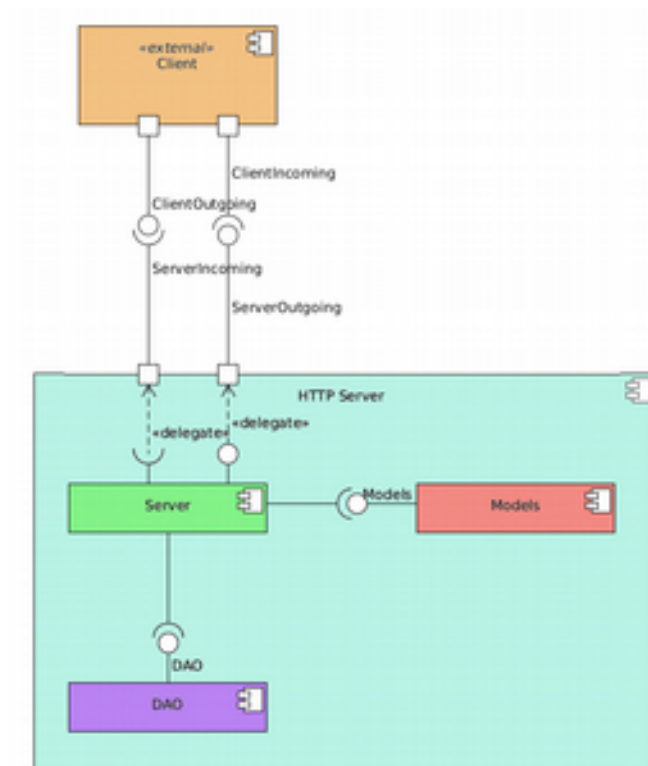

The described approach has been selected due to its simplicity and performance.

4.1 Package Design

AWA	Version: <1.0>

III. Elaboration – Iteration 1.2

1. Design Model

1.1 Dynamic Behavior

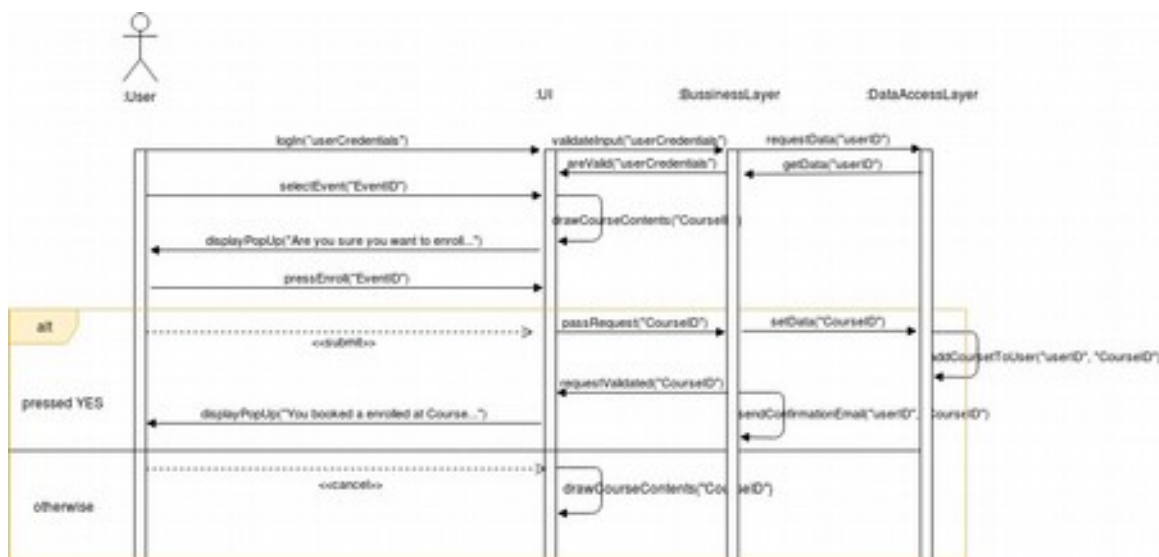

Course Enrollment Steps:

- The user logs in;
- The user queries through the available course options;
- The user selects the course he/she desires to enroll in (or wants to enroll their children in);
- The user presses the “enroll me” button at the bottom of the page, below the course description;
- Pop-up window displaying “Are you sure you want to enroll to Course X?” - No, Yes;
- The user presses Yes;
- Pop-up displaying “You have just enrolled to Course X. You must have received an e-mail confirmation and Course X should now appear under the <<my courses>> section in your profile”;
- The user will receive an e-mail confirmation and the course they just enrolled in will appear under the “my courses” section in their profile;

- **Extensions:** If the user presses the No button then the application cancels the enrollment and return to Course X main page.

Event Booking Steps:

- User logs in;
- The user queries through the available events options;
- The user selects the event he/she desires to attend;
- The user presses the “Book A Place” button at the bottom of the page, below the event description;
- Pop-up window displaying “Are you sure you want to book a place at Event X?” - No, Yes;
- The user presses Yes;
- Pop-up displaying “You have just booked yourself a place for Event X. You must have received an e-mail confirmation and Event X should now appear under the <<my events>> section in your profile”;
- The user will receive an e-mail confirmation and the event they just booked will appear under the “my events” section in their profile;

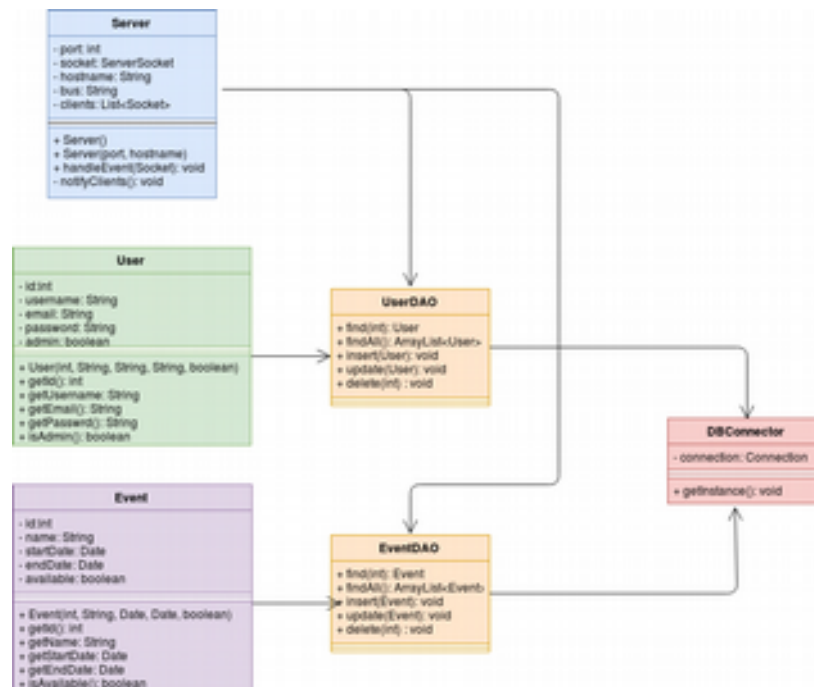

- **Extensions:** If there are no more places available at said event, then the user has the option of pressing “Let Me Know If a Place Becomes Available” button.
- If the user presses the No button then the application cancels the enrollment and return to Event X main page.

1.2 Class Design

The most important patterns used in this project's creation are the Command, Observer and Factory. The Command pattern is used to add functionality to the UI's buttons, the Observer pattern is useful for displaying data onto the UI, while the Factory pattern is used to create a connection of the back-end to the database. A conceptual class diagram can be seen below:

AWA	Version: <1.0>
Analysis and Design	Date: <10/04/2018>
<document identifier>	

2. Data Model

The presented system relies on 2 data models: the User data and the Event data. The User data encapsulates a user's username, email address and password, while the Event data model does so about the Event Credentials.

3. Unit Testing

[Present the used testing methods and the associated test case scenarios.]

IV. Elaboration – Iteration 2

1. Architectural Design Refinement

[Refine the architectural design: conceptual architecture, package design (consider package design principles), component and deployment diagrams. Motivate the changes that have been made.]

2. Design Model Refinement

[Refine the UML class diagram by applying class design principles and GRASP; motivate your choices. Deliver the updated class diagrams.]

V. Construction and Transition

1. System Testing

[Describe how you applied integration testing and present the associated test case scenarios.]

2. Future improvements

[Present future improvements for the system]
